

Your fencing is a valuable and high-profile advertising space!

Whether you are concealing or beautifying a construction site, promoting an event, or setting up barriers for outdoor activities such as marathons, races, skiing events or parades, fence wraps will make your location more attractive and appealing. Because our fence wraps are printed digitally, there are virtually no restrictions with respect to colours or design complexity. Your fence wrap graphics can be as simple as a company logo on a solid coloured background, or as detailed as a full-colour photograph or intricate design.

We have 4 substrates to choose from

Most common options:

Polymesh

Our favourite - not yet common in Canada but very popular in Europe.

- 100% polyester fabric. Digitally printed with DuPont dispersed dyes so the graphics are permanently sublimated into the fabric, with good bleed-through to the other side.
- Vibrant colours – more vibrant than with any of our other substrates.
- Strong and porous, able to withstand windy conditions.
- Lighter weight than traditional vinyl mesh, easy to transport and store.
- Machine washable. It can then be folded, stored, and re-used over and over again.
- Maximum height is 64", without having a seam to join two pieces.

Vinyl Mesh

Vinyl Mesh fence wraps are the most common types of fence wraps in Canada. But not all vinyl mesh is the same!

- Matte coated, printed on one side with HP latex inks. (Double-sided vinyl mesh is also available, although not commonly used for fence wraps).
- 8 ounce, strong and porous, able to withstand windy conditions.
- Can be stored for reuse, provided it is handled and stored correctly. If not handled carefully, the graphics on the surface will scratch. It must be rolled for transport and storage.
- Not as easy to clean as our fabric fence wrap options, because it must be washed by hand and laid out flat to dry before it can be stored.

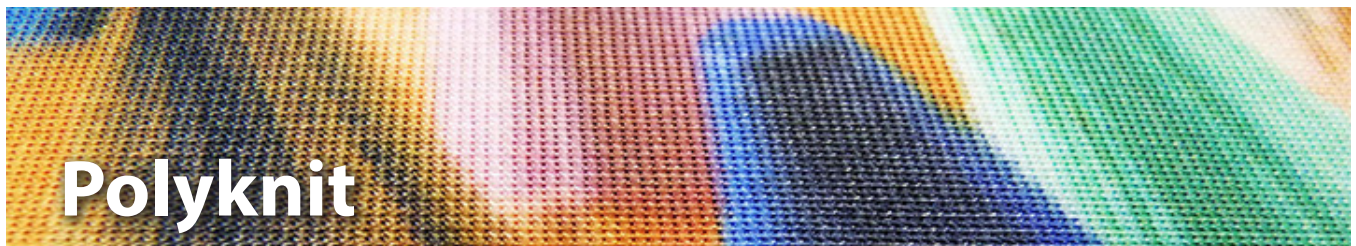

Less common options:

Scrim Vinyl

A long-term option and less costly than vinyl mesh.

- Printed on one side with HP latex inks (Double-sided scrim vinyl is also available, although not commonly used for fence wraps).
- Opaque. Windslots will be required if exposed to windy conditions.
- Heavier than traditional vinyl mesh. Not recommended when very large segments/pieces are required because the weight of the scrim vinyl makes the fence wrap more difficult to install.
- Can be stored for reuse, as long as it is handled and stored correctly. If not handled carefully, the graphics on the surface will scratch. It must be rolled for transport and storage.
- Not as easy to clean as our fabric fence wrap options, because it must be washed by hand and laid out flat to dry before it can be stored.

Polyknit

A cost-effective option - ideal for short-term use.

- 100% knitted polyester fabric. Digitally printed with DuPont dispersed dyes so the graphics are permanently sublimated into the fabric, with excellent bleed-through to the other side.
- Machine washable. It can then be folded, stored, and reused again.
- Lighter weight than traditional vinyl scrim, easy to transport and store.
- Wind resistant, but if the fabric becomes torn, the tear may expand quickly. Thus, it is not recommended for long periods when vandalism is possible.
- Maximum height is 64", without having a seam to join two pieces.

Helpful tip: Most rental fences come in 6' x 10' panels, and all our fence wrap substrates accommodate panels this size. Because soft substrates tend to expand/stretch over time, mainly due to fluctuating weather conditions, we recommend making fence wraps panels 1" to 1 ½" smaller (both in height and width) than the fence panel, to ensure that the fence wrap remains taut over time and does not sag.

Our fence wraps are manufactured in Canada and made out of high quality substrates with superior dyes and inks.
